

Andropogon gerardii

Big Bluestem

A tall, clump-forming grass, with blue-green foliage, turning rich bronze in fall. Also called turkeyfoot, because of its distinctive, three-forked seedheads. Remains standing throughout the winter. Big bluestem was one of the dominant grasses of the tallgrass prairie. Because of its height, best used as a single specimen plant, as a background plant, or in a naturalized setting. Its bronze color adds beautiful highlights to the winter garden. Don't fertilize it or it will flop over.

Suggested companions: bur oak (*Quercus macrocarpa*), indian grass (*Sorghastrum nutans*), little bluestem (*Schizachyrium scoparium*), switch grass (*Panicum virgatum*), a wide variety of prairie flowers such as goldenrods (*Solidago* sp.), blazing stars (*Liatris* sp.) and asters (*Aster* sp.)

Plant Type: Grass/Grasslike

Size: 4-9' H
W
